

Discussion 2 Questions

Quick Question 1

- In hypothesis testing, we talked about doing inference using a rejection region or using a p-value. Define these two terms.
 - What is the relationship between these two?

More Involved Question 1

- What are the biggest differences between the Frequentist and Bayesian paradigms for doing statistics?
 - What is our inferential goal in the Bayesian paradigm? What might we report for our inference?

Quick Question 2

- What is MCMC sampling about? Why do we sometimes need that and how do we use it for inference?

More Involved Question 2

- When doing hypothesis testing, we have two types of errors: type I and type II. How do these two types of errors play into our usual hypothesis testing setup?
 - How do we deal with type II errors?
 - What is the idea of statistical significance? What is the relationship with practical significance?

More Involved Question 3

- This is a tough one. We discussed Wald tests. Describe what a Wald test is.
 - We discussed t-tests as well. When are t-tests used?
 - Can we use a Wald test anytime we'd do a t-test? Can we use a t-test anytime we'd do a Wald test?
